**Description of Project:**

Platform for attaching photos to a geo-location, viewable by third parties

**Overview:**

The app would allow the user to take photos at a location and “leave” the photo there. The photo would appear on a map which other users can see; the photo would be viewable by the other users when they were within some predetermined distance of the location where the photo was taken.

Photos could either persist for only a limited time, or permanently, depending on the choice of the user. Furthermore, a photo could be optionally password-protected so only other users with the key could view the photo.

**Anticipated APIs and Technologies:**

GPS data  
Map  
Access to phone camera / photo library

**External Data Sources:**

None that I’m presently aware of

**Other Code:**

The app will probably require an external database, in SQL or something similar

**Past iOS Experience:**

None at all
